

Memory Acquisition

Remember to open command prompt as Administrator

Win32dd / Win64dd (x86 / x64 systems respectively)

/f Image destination and filename

C:\> **win32dd.exe /f E:\mem.img**

Mandiant Memoryze MemoryDD.bat

-output image destination

C:\> **MemoryDD.bat -output E:**

Volatility™ WinPmem

- (single dash) Output to standard out

-l Load driver for live memory analysis

C:\> **winpmem_<version>.exe**

Converting Hibernation Files and Crash Dumps

Volatility™ imagecopy

-f Name of source file (crash dump, hibernation file)

-o Output file name

--profile Source OS from **imageinfo**

vol.py imagecopy -f hiberfil.sys -o

hiber.img --profile=Win7SP1x64

vol.py imagecopy -f Memory.dmp -o

memdmp.img --profile=Win7SP1x64

Memory Analysis Tools

Volatility™ (Windows/Linux/Mac)

<http://code.google.com/p/volatility/>

Mandiant Redline (Windows)

<http://www.mandiant.com/resources/download/redline>

Volafox (Mac OS X and BSD)

<http://code.google.com/p/volafox/>

Memory Artifact Timelining

The Volatility™ Timeliner plugin parses time-stamped objects found in memory images. Output is sorted by:

- Process creation time
- Thread creation time
- Driver compile time
- DLL / EXE compile time
- Network socket creation time
- Memory resident registry key last write time
- Memory resident event log entry creation time

timeliner

--output-file Optional file to write output
--output=body body for mactime

```
# vol.py -f mem.img timeliner --output-file out.csv  
--profile=Win7SP1x64
```

Registry Analysis Volatility™ Plugins

hivelist - Find and list available registry hives
vol.py hivelist

hivedump - Print all keys and subkeys in a hive
-o Offset of registry hive to dump (virtual offset)
vol.py hivedump -o 0xe1a14b60

printkey - Output a registry key, subkeys, and values
-K "Registry key path"
vol.py printkey -K
"Software\Microsoft\Windows\CurrentVersion\Run"

userassist - Find and parse userassist key values
vol.py userassist

hashdump - Dump user NTLM and Lanman hashes
-y Virtual offset of SYSTEM registry hive (from
hivelist)

-s Virtual offset of SAM registry hive (from
hivelist)

```
# vol.py hashdump -y 0x8781c008 -s  
0x87f6b9c8
```

COMPUTER FORENSICS
and INCIDENT RESPONSE

Memory Forensics Cheat Sheet v1.1

POCKET REFERENCE GUIDE

SANS Institute

<http://computer-forensics.sans.org>

by Chad Tilbury

<http://forensicmethods.com>

Purpose

This cheat sheet supports the SANS FOR508 Advanced Forensics and Incident Response Course and SANS FOR526 Memory Analysis. It is not intended to be an exhaustive resource of Volatility™ or other highlighted tools. Volatility™ is a trademark of Verizon. The SANS Institute is not sponsored or approved by, or affiliated with Verizon.

How To Use This Document

Memory analysis is one of the most powerful tools available to forensic examiners. This guide hopes to simplify the overwhelming number of available options.

Analysis can be generally broken up into six steps:

1. Identify Rogue Processes
2. Analyze Process DLLs and Handles
3. Review Network Artifacts
4. Look for Evidence of Code Injection
5. Check for Signs of a Rootkit
6. Dump Suspicious Processes and Drivers

We outline the most useful Volatility™ plugins supporting these six steps here. Further information is provided for:

- Memory Acquisition
- Converting Hibernation Files and Crash Dumps
- Memory Artifact Timelining
- Registry Analysis Volatility™ Plugins
- Memory Analysis Tool List

Getting Started with Volatility™

Getting Help

```
# vol.py -h (show options and supported plugins)
# vol.py plugin -h (show plugin usage)
# vol.py plugin --info (show available OS profiles)
```

Sample Command Line

```
# vol.py -f image --profile=profile plugin
```

Identify System Profile

```
imageinfo - Display memory image metadata
# vol.py -f mem.img imageinfo
```

Using Environment Variables

Set name of memory image (takes place of **-f**)
export VOLATILITY_LOCATION=file:///images/mem.img
Set profile type (takes place of **--profile=**)
export VOLATILITY_PROFILE=WinXPSP3x86

Identify Rogue Processes

```
pslist - High level view of running processes
# vol.py pslist

psscan - Scan memory for EPROCESS blocks
# vol.py psscan

pstree - Display parent-process relationships
# vol.py pstree
```

Look for Evidence of Code Injection

```
malfind - Find injected code and dump sections
-p Show information only for specific PIDs
-o Provide physical offset of single process to scan
--dump-dir Directory to save memory sections
# vol.py malfind --dump-dir ./output_dir

ldrmodules - Detect unlinked DLLs
-p Show information only for specific PIDs
-v Verbose: show full paths from three DLL lists
# vol.py ldrmodules -p 868 -v
```

Check for Signs of a Rootkit

```
psxview - Find hidden processes using cross-view
# vol.py psxview

driverscan - Scan memory for _DRIVER_OBJECTs
# vol.py driverscan

apihooks - Find API/DLL function hooks
-p Operate only on specific PIDs
-k Scan kernel modules instead of user-mode objects
# vol.py apihooks

ssdt - Hooks in System Service Descriptor Table
# vol.py ssdt | egrep -v '(ntoskrnl|win32k)'

driverirp - Identify I/O Request Packet (IRP) hooks
-r Analyze drivers matching REGEX name pattern
# vol.py driverirp -r tcpip

idt - Display Interrupt Descriptor Table
# vol.py idt
```

Review Network Artifacts

```
connections - [XP] List of open TCP connections
# vol.py connections

connscan - [XP] ID TCP connections, including closed
# vol.py connscan

sockets - [XP] Print listening sockets (any protocol)
# vol.py sockets

sockscan - [XP] ID sockets, including closed/unlinked
# vol.py sockscan

netscan - [Win7] Scan for connections and sockets
# vol.py netscan
```

Dump Suspicious Processes and Drivers

```
dlldump - Extract DLLs from specific processes
-p Dump DLLs only for specific PIDs
-b Dump DLLs from process at physical memory offset
-r Dump DLLs matching REGEX name
--dump-dir Directory to save extracted files
# vol.py dlldump --dump-dir ./output -r metsrv

moddump - Extract kernel drivers
-o Dump driver using offset address (from driverscan)
-r Dump drivers matching REGEX name
--dump-dir Directory to save extracted files
# vol.py moddump --dump-dir ./output -r gaopdx

procmemdump - Dump process to executable sample
-p Dump only specific PIDs
-o Specify process by physical memory offset
--dump-dir Directory to save extracted files
# vol.py procmemdump --dump-dir ./out -p 868

memdump - Dump every memory section into a file
-p Dump memory sections from these PIDs
--dump-dir Directory to save extracted files
# vol.py memdump -dump-dir ./output -p 868
```

Analyze Process DLLs and Handles

```
dlllist - List of loaded dlls by process
-p Show information only for specific process identifiers
(PIDs)
# vol.py dlllist -p 4,868

getsids - Print process security identifiers
-p Show information only for specific PIDs
# vol.py getsids -p 868

handles - List of open handles for each process
-p Show information only for specific PIDs
-t Display only handles of a certain type
{Process, Thread, Key, Event, File, Mutant, Token, Port}
# vol.py handles -p 868 -t Process,Mutant

filescan - Scan memory for FILE_OBJECT handles
# vol.py filescan

svcscan - Scan for Windows Service information
# vol.py svcscan
```
